Dear Sir / Madam

### More High Grade Gold in Soil Samples at Hann Prospect

Eleckra Mines Limited ("Eleckra") (ASX: EKM) is pleased to announce that high gold results of **up to 19 g/t Au** were returned from the second batch of assays from the channel soil survey carried out in February and March 2010 at the Hann prospect at its 100%-owned Yamarna Gold Project. The Yamarna Project is located approximately 150 kilometres east of Laverton on the eastern edge of the Yilgarn Craton and within the Yamarna Greenstone Belt.

Eleckra is currently drilling at the high-grade Central Bore prospect and as part of this program intends to carry out its maiden RC drilling program at the neighbouring Hann and Byzantium prospects.

On 8<sup>th</sup> February 2010, Eleckra announced that a strong **2.8 kilometre-long gold anomaly** had been Identified at **Hann Prospect** 1.1 kilometres east of the **Attila Gold Deposit** and 2.4 kilometres west of the **Central Bore gold discovery** in a parallel magnetic structure. (Refer to Figure 1 and 2.) The soil geochemical program defined three parallel zones with elevated gold values consistent with the presence of coarse gold in soil samples.

On 12 April 2010, Eleckra announced that in order to better define the target area it carried out detailed **1-metre-channel soil sampling** over selected gold anomalies identified in the December 2009 survey at the Hann southern grid. The first batch of 988 samples returned excellent gold assay results with up to **361g/t Au (429g/t Au in repeat assay), 16g/t Au, 8.4g/t Au, 2.1g/t Au and 1.3g/t Au, each over 1 metre sample intervals.**

The results of the second batch of 827 samples recently received returned grades as impressive as the first batch with up to **19g/t Au, 3.5g/t Au (in repeat assay), 2.3g/t Au, and 1.1g/t Au.**

These results confirm the existence of numerous mineralised zones and the presence of coarse gold at Hann prospect (Refer to Figure 3 and Table 1 & 2). The width and length of the anomalous zones and the high-grade gold results in the soil survey at Hann provide substantial encouragement for locating further high grade gold mineralisation and represent an immediate high priority drilling target. The maiden RC drilling program at Hann prospect will systematically test these anomalies within the next few weeks.

#### NOTES:

The information in this report which relates to Exploration Results, or Mineral Resources is based on information compiled by Ziggy Lubieniecki, the General Manager of Eleckra Mines Limited, who is a Member of the Australasian Institute of Mining and Metallurgy and a Member of the Australian Institute of Geoscientists. Ziggy Lubieniecki has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration to qualify as a Competent Person as defined in the 2004 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Ziggy Lubieniecki consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.
