

DECEMBER 2023 QUARTERLY REPORT

HIGHLIGHTS

Production and Guidance

- Gruyere produced 74,659 ounces of gold¹ (100% basis) at an AISC of A\$1,973 per attributable ounce during the December 2023 quarter (September quarter: 88,668 ounces at an AISC of A\$1,682 per attributable ounce).
- Quarterly production was lower quarter on quarter due to delays accessing higher grade ore from the open pit. Labour availability impacted the ore mining rate.
- 2023 annual production from Gruyere was 321,984 ounces, delivering at the lower end of annual guidance of between 320,000 - 350,000 ounces. Gold Road's attributable 160,992 ounces of production was delivered at an attributable AISC of A\$1,662 per ounce falling just outside of guidance of between A\$1,540 to A\$1,660 per attributable ounce.
- 2024 annual production is guided at between 300,000 and 335,000 ounces (150,000 to 167,500 ounces attributable) at an attributable AISC of between A\$1,900 and A\$2,050 per ounce.

Financial and Corporate

- Gold Road's gold sales totalled 37,037 ounces at an average sales price of A\$3,040 per ounce. Gold doré and bullion on hand on 31 December 2023 was 1,989 ounces. Gold Road continues to be unhedged and 100% exposed to the spot gold price.
- Gold Road's attributable operating cash flow from Gruyere for the quarter was \$69.6 million (September quarter: \$93.5 million).
- Free cash flow was \$13.8 million for the quarter (September quarter: \$51.7 million).
- Gold Road's Corporate All-In Cost (**CAIC**) which includes growth capital, corporate and exploration costs was A\$2,390 per ounce for the December 2023 quarter.
- Cash and equivalents² decreased to approximately \$149.9 million (September quarter: \$209.3 million) with no debt drawn, following investments³ and a dividend payment totalling \$74.3 million during the quarter.
- As at 31 December 2023, Gold Road held listed investments with a market value of approximately \$465 million⁴.
- During 2023, Gold Road's attributable Mineral Resources of 4.50 million ounces and attributable Ore Reserves of 1.83 million ounces decreased by 0.29 million ounces and 0.19 million ounces respectively, largely as a result of mining depletion.

Discovery

- At Mallina (Gold Road 100%) a diamond drilling program was completed, intersecting encouraging geology and associated gold results. An airborne magnetic survey and a geological mapping campaign were also completed.

¹ As previously reported in ASX announcement on 3 January 2024

² Cash and equivalents refer to cash, doré and bullion on hand at 31 December 2023. It excludes listed investments.

³ Refer to ASX announcement dated 26 October 2023. Interim dividend payment of \$10.9 million and placements in De Grey Mining of \$62.7 million and Yandal Resources of \$0.7 million.

⁴ ASX listed investments valued at closing prices on 29 December 2023 (the last trading day of the quarter).

Introduction

Gold Road Resources Limited (**Gold Road** or the **Company**), presents its activity report for the quarter ending 31 December 2023. Production is from the Gruyere Gold Mine (**Gruyere**), a 50:50 joint venture with Gruyere Mining Company Pty Ltd, a member of the Gold Fields Ltd Group (**Gold Fields**), which operates Gruyere.

During the December 2023 quarter, Gruyere delivered quarterly gold production of 74,659 ounces (100% basis) (September quarter: 88,668 ounces). Production was delivered at an All-in-Sustaining Cost (**AISC**) of A\$1,973 per attributable ounce to Gold Road (September quarter: A\$1,682 per ounce).

Gruyere has now achieved over 1,000 days LTI free. The combined 12-month moving average Lost Time Injury Frequency Rate (**LTIFR**) for Gruyere (50% attributable) and Gold Road was 1.90 on 31 December 2023.

Production

Gruyere (100% basis)

Mining

Total material movement increased quarter on quarter to 10.7 Mt of which ore mining totalled 1.7 Mt during the quarter. The lower ore mining for the quarter is largely the result of delays accessing higher grade ore from the open pit following mining underperformance arising mainly from unexpected labour availability issues across the operation. These labour availability issues continue to be more pronounced in mining operations, particularly drill and blast activities where MACA, the contract miner at Gruyere, has been facing increasing challenges resourcing and maintaining the required workforce. The JV partners and MACA have focussed a considerable effort on this area through the second half of 2023 with increased investment in drill fleet and mining fleet, and a renewed focus on site management. Despite good progress during the September 2023 quarter, the December 2023 quarter saw another downturn in ore mining productivity as a result of low labour availability and the resulting delayed access to ore within the open pit. MACA and the JV partners are working to resolve these labour issues. Total material movement, including ore mining is anticipated to lift through 2024.

At the end of the quarter, ore stockpiles decreased to 5.0 Mt at 0.73 g/t Au (September quarter: 5.5 Mt at 0.74 g/t Au), reflecting the continued processing of stockpile material.

Processing

Total ore processed during the quarter decreased to 2.2 Mt at a head grade of 1.11 g/t Au, maintaining a strong gold recovery of 93.3%, for 74,659 ounces of gold produced. Gold production was lower quarter on quarter, principally as a result of the lower-than-expected run-of-mine ore from the open pit needing to be supplemented by the processing of low-grade ore stockpiles. As a result of the blending with low grade stockpiles, processing head grades were approximately 8% lower than mined ore grades for the quarter, and this was a key contributor to the lower production ounces quarter on quarter.

Construction of a Tailings Storage Facility lift continued during the quarter and is scheduled for completion in the second half of 2024. Late in the quarter, a severe weather event inflicted some damage to the Solar farm. Repairs have returned 95% of the solar farm to operation. No impact on production is expected.

Commissioning of the pebble crusher commenced as planned during the quarter, with the crusher commencing normal operation in early January 2024.

Cost Performance

AISC for the quarter was A\$1,973 per ounce (September quarter: A\$1,682). The increased AISC per ounce was largely attributable to the lower gold production, as well as higher waste mining and delays accessing higher grade ore.

2024 Guidance

2024 annual production is guided at between 300,000 to 335,000 ounces (150,000 to 167,500 ounces attributable) at an attributable AISC of between A\$1,900 and A\$2,050 per attributable ounce. 2024 will see increased material movement as per the life of mine plan, and also as result of the operation needing to catch up on missed movement in 2023. AISC costs are modelled for the 2024 inflationary environment and contain the capital cost associated with increased waste movement and the remaining portion of the tailings dam lift which commenced late last year.

Capital expenditure associated with 2024 production is determined as sustaining and consequently included in the 2024 AISC guidance. There is no additional growth capital expenditure guided at Gruyere in 2024.

Annual Mineral Resource and Ore Reserve Statement

The Gruyere JV Open Pit Mineral Resource is estimated at 139 million tonnes at 1.35 g/t Au for 6.04 million ounces. The Mineral Resource includes:

- Updated Gruyere Open Pit Mineral Resource of **123 million tonnes at 1.32 g/t Au for 5.22 million ounces** (constrained within an A\$2,300 per ounce pit shell), a decrease of 0.65 million ounces (-11%) largely the result of mining depletion and a reduction in size of the constraining pit shell due to increased cost assumptions
- No changes year on year to the Golden Highway Mineral Resource of 14 million tonnes at 1.44 g/t Au for 0.67 million ounces

The Gruyere JV Ore Reserve totals **91 million tonnes at 1.25 g/t Au for 3.67 million ounces** (reported at a A\$2,000 per ounce gold price assumption). The Ore Reserve includes:

- An updated Gruyere Ore Reserve of 85 million tonnes at 1.24 g/t Au for 3.38 million ounces, a decrease of 0.38 million ounces mostly due to mining depletion during 2023
- No changes to the Golden Highway Ore Reserve of 7 million tonnes at 1.29 g/t Au for 0.29 million ounces

Gold Road’s Gruyere Underground Mineral Resource estimate has increased very slightly by an attributable 0.03 million ounces (+4%) due to the smaller open pit resource shell. The evaluation (constrained within A\$2,000 per ounce stope shapes) now defines an inventory of 43 million tonnes at 1.41 g/t Au for a total of 1.96 million ounces from which Gold Road reports an attributable (50%) Underground Inferred Mineral Resource of **22 million tonnes at 1.41 g/t Au for a total of 0.98 million ounces**.

Gold Road’s 100% owned Yamarna Mineral Resources (Renegade, Gilmour, Smokebush and Warbler) remain unchanged year on year at 6 million tonnes at 2.44 g/t Au for 0.51 million ounces.

Gold Road’s total attributable Mineral Resources of 4.50 million ounces have consequently decreased by 0.29 million ounces primarily as a result of mining depletion during 2023. Gold Road’s attributable Ore Reserves of 1.83 million ounces have decreased by 0.19 million ounces primarily as a result of mining depletion at the Gruyere Open Pit in 2023. Mineral Resource and Ore Reserve tables are contained in the appendix to this report.

Figure 1: Gruyere Mine long projection (looking west) illustrating the 2023 Mineral Resource and Ore Reserve outlines, 2024 exploration areas

Gruyere 2024 Exploration Program – Drilling Beneath Current Ore Reserves and Underground Scoping Study

Further work at Gruyere in 2024 will involve diamond drilling focussed on areas within and to the north of the deepest portion of the resource shell (Figure 1) and beneath the current Ore Reserve. The program is aimed at improving upon existing drill coverage with the intention of potentially upgrading current resource confidence and assessing the potential for extensions to the current Ore Reserve and mine life.

A small amount of RC and diamond drilling will also be completed during 2024 to test for a potential new high-grade shoot to the north of the Gruyere Open Pit resource.

In addition to the planned drilling beneath the current Ore Reserve pit shell, a scoping study will commence in 2024 to assess the opportunity for a future underground operation at Gruyere. Previous concept studies indicate potential to transition Gruyere to an underground operation beyond its current open pit reserve life, leveraging existing site infrastructure. The scoping study will be undertaken by an independent consultant and will review multiple potential underground options.

Gruyere JV Exploration – Golden Highway

Gruyere JV exploration efforts during the quarter continued to be focused on the Golden Highway Project, located approximately 25 kilometres to the west of the Gruyere mine site (Figure 2).

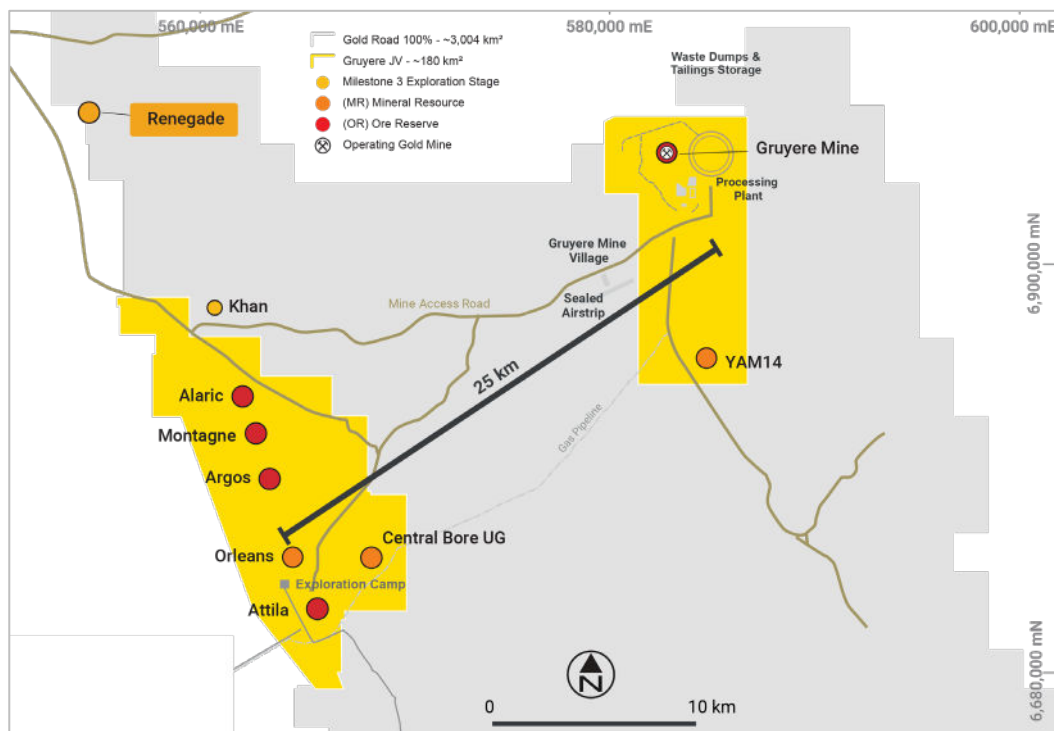

Figure 2: Plan view showing location of Golden Highway Deposits (Gruyere JV)

During the December quarter, work continued to support feasibility level studies in preparation for mining operations that are anticipated to commence in early 2026.

Financial and Corporate

Financial Update

As at 31 December 2023, the Company held cash and equivalents of \$149.9 million with no debt drawn.

During the quarter, Gold Road sold 37,037 ounces at an average price of A\$3,040 per ounce for sales revenue of \$112.6 million. Gold sales for the quarter do not include 1,989 ounces of gold doré and bullion held in inventory on 31 December 2023. Gold Road continues to be unhedged and 100% exposed to the spot gold price.

Gold Road's attributable operating cash flow from Gruyere for the quarter was \$69.8 million. Capital expenditure was \$28.5 million, with the bulk of this sustaining capital expenditure representing the installation of the Pebble Crusher and the raise on the Tailings Storage Facility. Exploration expenditure was 11.8 million and corporate costs totalled \$3.2 million. Finance/Lease costs of \$4.9 million included the cost of debt facilities and finance lease payments (Figure 3).

Gold Road's Corporate All-In Cost (CAIC) which includes growth capital, corporate and exploration costs was A\$2,390 per ounce for the December 2023 quarter. Gold Road's group free cash flow for the quarter was \$13.8 million (September quarter: \$51.7 million). Free cash flow is reported before the payment of the dividend and investments in listed securities.

Figure 3: Cash and equivalents movement for December 2023 quarter. *Cash and equivalents refers to cash, doré and bullion

During the quarter, Gold Road subscribed for 59,675,554 shares in an institutional placement by De Grey Mining Ltd (ASX:DEG) at \$1.05 per share for a total commitment of \$62.7 million⁵. During the quarter, Gold Road also subscribed for 13,375,283 shares, and 6,887,641 attached options exercisable at \$0.11 before November 2025, in a share placement by Yandal Resources Ltd (ASX:YRL) at \$0.052 per share for a total commitment of \$0.7 million.

On 5 October 2023, Gold Road paid \$10.9 million to shareholders as a fully franked dividend of 1.2 cents per share for the six months to 30 June 2023.

Share Capital

As at 31 December 2023, the Company had 1,081,201,240 ordinary fully paid shares on issue and 6,229,754 performance rights granted with various vesting and expiration dates.

Listed Investments

As at 31 December 2023, the Company had listed investments with a market value of approximately \$465 million⁶ including a strategic shareholding of 19.9% in De Grey Mining Ltd.

⁵ On 5 October 2023, Gold Road paid \$51.9 million for the first tranche institutional placement and was issued 49,438,097 new shares in De Grey Mining Ltd. The second tranche of 10,237,457 new shares at a commitment of \$10.8 million received De Grey shareholder approval on 9 November 2023.

⁶ Valued at closing prices on 29 December 2023, the last day of ASX trading in the quarter

Discovery

Gold Road’s exploration strategy remains directed at delivering economic gold deposits that can be developed as standalone mining operations, creating shareholder value through organic growth.

Gold Road holds an extensive greenfields exploration portfolio across several prospective regions of Australia (Figure 4). Ongoing target identification, evaluation and optimisation of this large portfolio is aimed at creating a high-quality exploration project pipeline that provides significant value to the business.

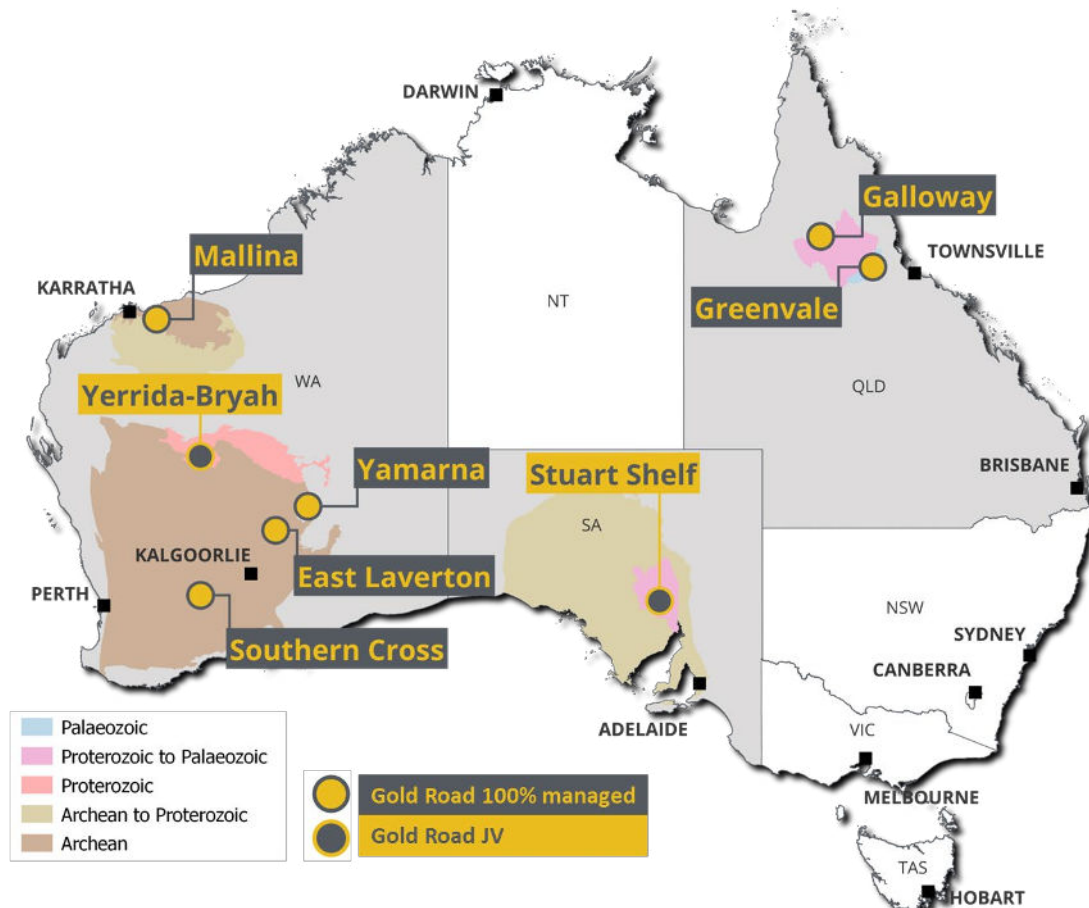

Figure 4: Map showing location of Gold Road’s exploration projects over key geological terranes

Yamarna (100% Gold Road)

At Yamarna, a total of 16,407 metres of aircore, 5,702 metres of RC and 3,244.7 metres of diamond drilling was completed during the December quarter. Aircore activity was focused over early stage targets at Jatz, Hopwood and Beefwood that had not seen drill testing previously, while programs of RC and diamond drilling were completed at Hopwood South and Beefwood.

Aircore drilling was completed at Hopwood and Beefwood, targeting an underexplored region of the Dorothy Hills greenstone belt and shear zone, along strike and to the south of the Gruyere mine. Final assay results are pending.

At Hopwood South and Beefwood RC and diamond drilling programs were completed. Drilling intersected pervasively hematite altered porphyritic granitoid with frequent smoky quartz veins with associated chlorite-sulphide alteration. Assay results are pending.

Mallina (100% Gold Road)

During the December quarter, a program of 3,298 metres of diamond drilling was completed to follow up on earlier RC drilling results. Mineralisation is predominantly hosted in a hydrothermally altered granodiorite that has intruded into sediments (Mallina Formation). Mineralisation is currently defined over a 500 metre strike length and is characterised by thick (150 to 250 metres) zones of anomalous gold grades with sporadic and often narrow high grades up to 39.90 g/t Au. Partial results for the recent diamond drilling program have been received (the full program of assay results is expected in the March 2024 quarter), and include:

- MALDD00002: 0.66 metres at 8.96 g/t Au from 334.47 metres
- MALDD00002: 1.12 metres at 3.82 g/t Au from 576.06 metres
- MALRC00005D: 0.50 metres at 2.15 g/t Au from 336.50 metres
- MALRC00005D: 0.30 metres at 5.33 g/t Au from 379.30 metres
- MALRC00005D: 2.00 metres at 1.49 g/t Au from 539.0 metres
- MALRC00009D: 0.31 metres at 39.90 g/t Au from 346.81 metres

Other activities completed during the December quarter included a mapping campaign and a high-resolution airborne geophysical survey covering approximately 187 square kilometres.

Galloway and Greenvale (100% Gold Road)

During the December quarter, field activities across the Greenvale and Galloway projects were reduced owing to the commencement of the wet season across northern Queensland. Interpretation and target identification was completed, with preparations underway to commence drill testing in early 2024. An Exploration Manager for Eastern Australia, commenced in November and recruitment of additional geologists and field staff is underway.

East Laverton and Southern Cross (100% Gold Road)

During the December quarter, Gold Road acquired Abarta Resources Limited, a privately owned company. Abarta holds a tenement package in East Laverton and Southern Cross. Gold Road will be testing these early-stage projects in 2024.

This release has been authorised by the Board.

Mineral Resource Notes:

- OP = Open Pit and UG = Underground
- All Mineral Resources are completed in accordance with the JORC Code 2012 Edition
- All figures are rounded to reflect appropriate levels of confidence. Apparent differences may occur due to rounding
- Mineral Resources are inclusive of Ore Reserves. Gruyere Measured category includes Surface Stockpiles (5.55 Mt at 0.71 g/t Au for 0.13 Moz). Mineral Resources are depleted for mining
- The Gruyere JV is a 50:50 joint venture between Gold Road and Gruyere Mining Company Pty Ltd, a wholly owned Australian subsidiary of Gold Fields Ltd. Figures are reported on a 100% basis unless otherwise specified, 50% is attributable to Gold Road. Gold Road's 50% attributable Mineral Resource for Gruyere Underground is reported independently of the Gruyere JV
- The Gruyere and Golden Highway Open Pit Mineral Resources are reported between 0.47 to 0.58 (oxide) and 0.50 to 0.61 (fresh) g/t Au cut-off grade. The Orleans and YAM14 Open Pit Mineral Resources are reported at 0.4 g/t Au cut-off grade. The Renegade, Gilmour, Smokebush and Warbler Mineral Resource are reported at 0.5 g/t Au cut-off grade. Cut-off grades allow for processing costs, recovery and haulage to the Gruyere Mill
- The Gruyere Open Pit Mineral Resource is constrained within a A\$2,300 per ounce optimised pit shell. The Golden Highway, Orleans and YAM14 Open Pit Mineral Resources are constrained within A\$2,000 per ounce optimised pit shells. The Renegade, Gilmour, Smokebush and Warbler Open Pit Mineral Resources are constrained within A\$2,200 per ounce optimised pit shells. Gold prices are derived from mining, processing and geotechnical parameters from the Golden Highway PFS, the Gruyere FS and current Gruyere JV operational cost data
- The Underground Mineral Resource at Gruyere was evaluated by Gold Road on the same geology model used to estimate the December 2023 Open Pit Mineral Resource. The model was evaluated exclusively below the A\$2,300 per ounce pit optimisation shell utilised to constrain the Open Pit Mineral Resource and is reported as 100% in the Inferred category
- The Underground Mineral Resource at Gruyere is constrained by Mineable Shape Optimiser (MSO) shapes of dimensions consistent with underground mass mining. The MSO shapes are optimised at cut-off grades based on benchmarked mining costs, current Gruyere operating costs and processing recoveries at a A\$2,000 per ounce gold price
- Underground Mineral Resources at Gruyere considered appropriate for potential mass mining exploitation in the Central Zone are constrained within MSO shapes of 25 metre minimum mining width in a transverse orientation and 25 metre sub-level interval, and are optimised to a cut-off grade of 1.0 g/t Au
- Underground Mineral Resources at Gruyere considered appropriate for potential mass mining exploitation in the Northern Zone are constrained within MSO shapes of 5 metre minimum mining width in longitudinal orientation and 25 metre sub-level interval and are optimised to a cut-off grade of 1.5 g/t Au
- Underground Mineral Resources at Central Bore are constrained by a 1.5 metre minimum stope width that are optimised to a 3.5 g/t Au cut-off reflective of a A\$1,850 per ounce gold price
- Underground Mineral Resources at Gilmour are constrained by an area defined by a 2 metre minimum stope width and a 3.0 g/t Au cut-off reflective of a A\$2,200 per ounce gold price
- Underground Mineral Resources are reported with diluted tonnages and grades based on minimum stope widths

Ore Reserve Notes:

- OP = Open Pit
- All Ore Reserves are completed in accordance with the 2012 JORC Code Edition
- All figures are rounded to reflect appropriate levels of confidence. Apparent differences may occur due to rounding.
- The Gruyere JV is a 50:50 joint venture between Gold Road and Gruyere Mining Company Pty Limited, a wholly owned Australian subsidiary of Gold Fields Ltd. Figures are reported on a 100% basis unless otherwise specified, 50% is attributable to Gold Road
- Gold Road holds an uncapped 1.5% net smelter return royalty on Gold Fields' share of production from the Gruyere JV once total gold production exceeds 2 million ounces
- The pit design for reporting the Gruyere Ore Reserve is derived from mining, processing and geotechnical parameters as defined by operational studies, FS and PFS level studies completed between 2019 and 2023 and the 2016 FS. The Ore Reserve is reported using the 2023 Mineral Resource model constrained within the pit design (which is derived from a A\$1,575 per ounce optimisation) and with Ore Reserves reported at A\$2,000 per ounce gold price
- The Ore Reserve for the Golden Highway Deposits which include Attila, Argos, Montagne and Alaric is constrained within a A\$2,000 per ounce mine design derived from mining, processing and geotechnical parameters as defined by the 2020 PFS and operational studies
- The Ore Reserve is evaluated using variable cut-off grades (fresh, transitional and oxide respectively): Gruyere - 0.57, 0.54, 0.54 g/t Au. Attila - 0.69, 0.62, 0.58 g/t Au. Argos - 0.64, 0.64, 0.62 g/t Au. Montagne - 0.67, 0.60, 0.59 g/t Au. Alaric - 0.68, 0.68, 0.66 g/t Au
- Ore block tonnage dilution and mining recovery estimates: Gruyere - 6% and 99%. Attila - 21% and 99%. Argos - 17% and 89%. Montagne - 15% and 94%. Alaric - 31% and 99%
- Gruyere Proved category includes Surface Stockpiles. Ore Reserves are depleted for mining

Competent Persons Statements

Exploration Results

The information in this report which relates to Exploration Results is based on information compiled by Mr Andrew Tyrrell, General Manager - Discovery. Mr Tyrrell is an employee of Gold Road, and a Member of the Australasian Institute of Geoscientists (MAIG 7785). Mr Tyrrell is a holder of Gold Road Performance Rights.

Mr Tyrrell has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr Tyrrell consents to the inclusion in the report of the matters based on this information in the form and context in which it appears.

Mineral Resources

The information in this report that relates to the Mineral Resource estimation for the Gruyere, Attila, Argos, Montagne and Alaric Open Pits is based on information compiled by Mr Richard Tully. Mr Tully is an employee of Gold Fields Australia, and is a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM 992513) and a Member of the Australian Institute of Geoscientists (MAIG 2716).

Mr John Donaldson, Principal Resource Geologist for Gold Road has endorsed the Open Pit Mineral Resource estimates for Gruyere, Attila, Argos, Montagne and Alaric on behalf of Gold Road. Mr Donaldson is an employee of Gold Road and a Member of the Australian Institute of Geoscientists and a Registered Professional Geoscientist (MAIG RPGeo Mining 10147). Mr Donaldson is a shareholder and a holder of Performance Rights.

The information in this report that relates to the Mineral Resource estimation for Gruyere and Central Bore Underground, and the Orleans, YAM14, Renegade, Gilmour, Smokebush and Warbler Open Pits is based on information compiled by Mr John Donaldson, Principal Resource Geologist for Gold Road

Messrs Tully and Donaldson have sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as Competent Persons as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves". Messrs Tully and Donaldson consent to the inclusion in the report of the matters based on this information in the form and context in which it appears.

Ore Reserves

The information in this report that relates to the Ore Reserve estimation for Gruyere, Attila, Montagne, Argos and Alaric is based on information compiled by Mr Sawan Prehar. Mr Prehar is an employee of Gold Fields Australia and a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM 3111441).

Mr Jeff Dang, Manager - Mining and Corporate Development for Gold Road has endorsed the Ore Reserve estimation for Gruyere on behalf of Gold Road. Mr Dang is an employee of Gold Road and is a Member of the Australasian Institute of Mining and Metallurgy (MAusIMM 307499). Mr Dang is a holder of Performance Rights.

Messrs Prehar and Dang have sufficient experience that is relevant to the style of mineralisation and type of deposits under consideration and to the activity currently being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Messrs Prehar and Dang consent to the inclusion in this announcement of the matters based on this information in the form and context in which it appears.

New Information or Data

Gold Road confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and, in the case of estimates of Mineral Resources and Ore Reserves that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed.

The Company confirms that the form and context in which the Competent Person's findings are presented have not materially changed from the original market announcement

Appendix 1 – Drilling information – Diamond.

Appendix 4 - JORC Code 2012 Edition Table 1 Report

Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections)

Criteria and JORC Code explanation	Commentary
<p><i>Sampling techniques</i> <i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i></p>	<p>Sampling has been carried out using Diamond drilling (DDH), reverse circulation (RC) and Aircore (AC). DDH: Drill core is logged geologically and marked up for sampling and analysis at variable intervals based on geological observations, ranging typically between 0.20-1.20 m. Drill core is cut in half by a Diamond saw and half core samples submitted for assay analysis. Where core is highly fractured and contains coarse gold, whole core samples may be selected for sample submission. RC: Samples were collected as drilling chips from the RC rig using a cyclone collection unit and directed through a static cone splitter, or with sample scoops, to create a 2-3 kg sample for assay. RC samples are taken as individual metre samples AC: Samples are collected with a sample scoop and composited to 4m. A one metre sample is collected from the end of hole.</p>
<p><i>Include reference to measures taken to ensure sample representation and the appropriate calibration of any measurement tools or systems used.</i></p>	<p>Sampling was carried out under Gold Road's protocol and QAQC procedures. Laboratory QAQC was also conducted. See further details below. Core is cut and prepared for despatch to the laboratory at Gold Road's project sites and facilities.</p>
<p><i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i></p>	<p>DDH: Diamond drilling was completed using a HQ or NQ drilling bit for all holes. Core is cut in half for sampling, with a half core sample sent for assay at measured intervals. Sample weights average ~2.0 kg and range from ~0.6 to 2.8 kg. RC: holes were drilled with a 5.5-inch face-sampling bit, 1 m samples collected through a cyclone and static cone splitter or sample scoop, to form a 2-3 kg sample. Assays: DDH and RC samples were assayed for gold by Fire Assay at ALS in Perth, check assays were completed by Intertek in Perth. Fire Assay, 0.01 g/t Au and lower detection limit, are used for earlier stage (Milestone 1 to Milestone 3) exploration programs where low detection limits are required for detecting anomalies associated with mineralised systems.</p>
<p><i>Drilling techniques</i> <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of Diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i></p>	<p>DDH: DDH drilling rigs are utilised for collecting diamond core samples, HQ (61.1 mm) and NQ (45.1 mm) size for geological logging, sampling and assay. All suitably competent drill core (100%) is oriented using Reflex digital orientation tools, with core initially cleaned and pieced together at the drill site, and fully orientated by Gold Road field staff at Gold Road project sites and facilities. In broken ground, triple tube diamond core may be selected to be collected. Diamond tails are drilled from RC pre-collars to both extend holes when abandoned and reduce drilling costs when appropriate. RC: RC drilling rigs utilise a face-sampling RC bit which has a diameter of 5.5 inches (140 mm).</p>
<p><i>Drill sample recovery</i> <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i></p>	<p>DDH: All diamond core collected is dry. Driller's measure core recoveries for every drill run completed using 3 and 6 m core barrels. The core recovered is physically measured by tape measure and the length recovered is recorded for every "run". Core recovery can be calculated as a percentage recovery. Almost 100% recoveries were achieved, with minimal core loss recorded. RC: The majority of RC samples were dry. Drilling operators' ensured water was lifted from the face of the hole at each rod change to ensure water did not interfere with drilling and to make sure samples were collected dry. The procedure is to record wet or damp samples in the database. RC recoveries for Milestone 1-3 targets are visually estimated, and recoveries recorded in the log as a percentage. 1/10 RC holes were green bagged to accurately calculate recoveries for Milestone 4-5 targets. Recovery of the samples was good, generally estimated to be full, except for some sample loss at the top of the hole. Gold Road procedure is to stop RC drilling if water cannot be kept out of hole and continue with a DDH tail at a later time if required.</p>
<p><i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i></p>	<p>DDH: Diamond drilling collects uncontaminated fresh core samples which are cleaned at the drill site to remove drilling fluids and cuttings to present clean core for logging and sampling. RC: Face-sample bits and dust suppression were used to minimise sample loss. Drilling airlifted the water column above the bottom of the hole to ensure dry sampling. RC samples are collected through a cyclone and static cone splitter or with sample scoops, with the rejects deposited either on the ground in piles for milestone 1-3 prospects or in a plastic bag for milestone 4-5 prospects where required and a 2 to 3 kg lab sample collected.</p>

Criteria and JORC Code explanation	Commentary
<i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	DDH: No sample bias or material loss was observed to have taken place during drilling activities. RC: No significant sample bias or material loss was observed to have taken place during drilling activities.
<i>Logging Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.</i>	All chips and drill core were geologically logged by Gold Road geologists, using the Gold Road logging scheme.
<i>Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.</i>	Logging of DDH core records lithology, mineralogy, mineralisation, alteration, structure, weathering, colour and other features of the samples. All core is photographed in the core trays, with individual photographs taken of each tray both dry and wet. Logging of RC chips records lithology, mineralogy, mineralisation, weathering, colour and other features of the samples. All samples are wet-sieved and stored in a chip tray. Chip trays are photographed.
<i>The total length and percentage of the relevant intersections logged</i>	All holes were logged in full.
<i>Sub-sampling techniques and sample preparation If core, whether cut or sawn and whether quarter, half or all core taken.</i>	Core samples were cut in half using an automated diamond saw. Half core samples were collected for assay, and the remaining half core samples stored in the core trays. For heavily broken ground not amenable to cutting, whole core sampling may be taken but is not a regular occurrence.
<i>If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.</i>	RC: Drill samples collected with a sample scoop or channelled through a static cone-splitter, installed directly below a rig mounted cyclone, and an average 2-3 kg sample is collected in a numbered calico bag. >95% of samples were dry, and whether wet or dry is recorded.
<i>For all sample types, the nature, quality and appropriateness of the sample preparation technique.</i>	Fire Assay: Most samples (DDH and RC) are prepared at ALS or Intertek in Perth. Samples were dried, and the whole sample pulverised to 85% passing 75 µm, and a sub-sample of approx. 200 g retained. A nominal 50 g was used for the Fire Assay analysis. The procedure is appropriate for this type of sample and analysis. The procedure is appropriate for this type of sample and analysis. The coarse crush is the preferred sample preparation method to minimise contamination and maximise sample weight. Pulverisation was used in order to provide a finer product for pXRF analysis.
<i>Quality control procedures adopted for all sub-sampling stages to maximise representation of samples.</i>	DDH: No duplicates were collected for diamond holes.
<i>Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling.</i>	RC: A duplicate field sample is taken from the cone splitter at a rate of approximately 1 in 20-30 samples and is determined by the mineralised system that is targeted. At the laboratory, regular Repeats and Lab Check samples are assayed.
<i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i>	Sample sizes are considered appropriate to give an indication of mineralisation given the expected particle size.
<i>Quality of assay data and laboratory tests The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i>	Fire Assay: Samples were analysed at ALS and Intertek in Perth. The analytical method used was a 50 g Fire Assay for gold only, which is considered to be appropriate for the material and mineralisation.
<i>For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.</i>	Portable (handheld) XRF analysis in the lab is completed by Lab Staff. Portable XRF machines are calibrated at beginning of each shift. Read times for all analyses are recorded and included in the Lab Assay reports. Detection limits for each element are included in Lab reports. ASD TerraSpec mineral spectrometry in the lab is completed by Lab Staff. ASD machines are calibrated at the beginning of each shift and parameters for all analyses are recorded and provided in the Lab Assay reports.
<i>Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.</i>	Gold Road protocols for: DDH is for Field Standards (Certified Reference Materials) and Blanks inserted at a rate of 4 Standards and 4 Blanks per 100 samples. No field duplicates are collected. RC is for Field Standards (certified Reference Materials) and Blanks inserted at a rate of 2-4 Standards and 2-4 Blanks per 100 samples. Field duplicates are generally inserted at a rate of approximate 1 in 20-30. Gold Road QAQC protocols were met and analysis of results passed required hurdles to ensure acceptable levels of accuracy and precision attained for the milestone level and use of the respective results for resource evaluation and reporting.
<i>Verification of sampling and assaying The verification of significant intersections by either independent or alternative company personnel.</i>	Significant results are checked by the Exploration Manager (or delegate), Principal Resource Geologist and General Manager - Discovery. Additional checks are completed by Field Geologists and the Database Manager. QAQC reports are completed on each batch of assays received and a monthly report is also completed by the Project Geologist and Database Manager – results were acceptable.
<i>The use of twinned holes.</i>	No specific twinning was completed as part of these programs.

Criteria and JORC Code explanation	Commentary
<i>Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.</i>	All data are stored in a Datashed/SQL database system and maintained by the Database Manager. All field logging is carried out on mobile computers using industry standard geological logging applications. Logging data is synchronised electronically to the Datashed Database. Assay files are received electronically from the Laboratory.
<i>Discuss any adjustment to assay data.</i>	No assay data was adjusted. The lab's primary gold assay field is the one used for plotting and resource purposes. No averaging is employed.
<i>Location of data points Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.</i>	DDH and RC locations were set out for drilling by handheld GPS, with an accuracy of 5 m in Northing and Easting. DDH and RC collars are surveyed post drilling using an EMLIBDGPS system operated by Gold Road technicians, the Gruyere Mine Survey Team and/or contract surveyors. Accuracy for Northing, Easting and mRL is < ~1 to 3 cm. For angled DDH and RC drill holes, the drill rig mast is set up using a clinometer with verification of azimuth and dip using either a Reflex azi-aligner or north seeking gyro. Drillers use a true north seeking gyroscope at variable intervals while drilling and an end of hole survey with a nominal 10 m interval spacing between points.
<i>Specification of the grid system used.</i>	Yamarna: Grid projection is GDA94, MGA Zone 51. Mallina: Grid projection is GDA94, MGA Zone 50. Greenvale: Grid projection is GDA94, MGA Zone 55. Galloway: Grid projection is GDA94, MGA Zone 55.
<i>Quality and adequacy of topographic control.</i>	RL's are allocated to the drill hole collars using detailed DTM's generated during aeromagnetic and ground gravity survey data. The accuracy of the DTM is estimated to be better than 1 to 2 m in elevation. Where Lidar is available, such as over the central area of Yamarna, accuracy of elevation is better than 0.01 to 0.02 metres.
<i>Data spacing and distribution Data spacing for reporting of Exploration Results.</i>	Hopwood South, Beefwood and Mallina: RC and DDH holes are variably spaced depending on the target.
<i>Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i>	Golden Highway: Drill spacing required for Indicated and Inferred classification is well established and the drill program was designed at specific spacings to support those categories as required. Mallina: Not applicable.
<i>Whether sample compositing has been applied.</i>	Golden Highway/Mallina: No sample compositing was applied to RC or DDH samples.
<i>Orientation of data in relation to geological structure Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>	Mallina: The orientation of the drill holes (-70 dip, 10 or 180 degrees azimuth) is approximately perpendicular to the strike of the regional structure.
<i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i>	A sampling bias has not been introduced. Bedrock drill testing is considered to have been approximately perpendicular to strike and dip of mineralisation.
<i>Sample security The measures taken to ensure sample security.</i>	Pre-numbered calico sample bags were collected in plastic bags (five calico bags per single plastic bag), sealed, and transported by company transport to ALS in Perth. Pulps were retrieved from dry storage, sealed, and transported by company transport to Intertek, Perth.
<i>Audits or reviews The results of any audits or reviews of sampling techniques and data.</i>	Sampling and assaying techniques are industry standard. Internal reporting of QAQC is completed monthly.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria and JORC Code explanation	Commentary
<p><i>Mineral tenement and land tenure status</i></p> <p><i>Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.</i></p>	<p>At Yamarna, the Tenements are located within the Yilka Native Title Determination Area (NNTT Number: WCD2017/005), determined on 27 September 2017.</p> <p>The activity occurred within the Cosmo Newberry Reserves for the Use and Benefit of Aborigines. Gold Road signed a Deed of Agreement with the Yilka Talintji Aboriginal Corporation RNTBC in December 2022, which governs the exploration activities on these Reserves.</p> <p>At Mallina, the Tenements are located within the Ngarluma Native Title Determination Area (NNTT WCD2005/001), determined on 2 May 2005, amended 27 August 2007, further varied on 2 October 2020.</p> <p>The activity occurred within Ngarluma determined land. Yandan Gold Mines Pty Ltd, a subsidiary of Gold Road Resources Limited signed the Ngarluma Native Title and Heritage Exploration Agreement on 15 December 2020, which governs exploration activities within the Ngarluma determined land.</p> <p>The Tenements are also situated across three Pastoral Stations. A Land Access and Compensation Agreement between Yandan Gold Mines Pty Ltd and the Pastoral company was signed in 2020, which was amended by Deed of Variation on 3 July 2023.</p> <p>The Mallina drilling occurred within tenement E37/4316.</p> <p>At Greenvale, the Tenements are located within the Gugu Badhun Native Title Determination Area (NNTT QCD2012/002), determined on 1 August 2012. The activity occurred within Gugu Badhun determined land.</p> <p>A Native Title, Heritage Protection and Exploration Agreement between Gugu Badhun Aboriginal Corporation RNTBC and Gold Alpha Investments Pty Ltd, a subsidiary of Gold Road Resources Ltd was signed on 27 June 2023, which governs exploration activities within the Gugu Badhun determined land.</p> <p>The Tenements are also situated across several Pastoral Stations. In accordance with Queensland regulations, Entry Notices for Private Land were provided to the Pastoral Station owners and occupiers.</p> <p>At Galloway, the Tenements are located within Ewamian People Native Title Determination Area (NNTT QCD2013/006), determined on 26 November 2013. The activity occurred within Ewamian Peoples determined land.</p> <p>A Native Title, Heritage Protection and Exploration Agreement between Ewamian People Aboriginal Corporation RNTBC and Gold Alpha Investments Pty Ltd, a subsidiary of Gold Road Resources Ltd was signed on 29 March 2023, which governs exploration activities within the Ewamian People determined land.</p> <p>The Tenements are also situated across several Pastoral Stations. In accordance with Queensland regulations, Entry Notices for Private Land were provided to the Pastoral Station owners and occupiers.</p>
<p><i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i></p>	<p>The security of all tenements is in good standing with the relevant regulatory body.</p>
<p><i>Exploration done by other parties</i></p> <p><i>Acknowledgment and appraisal of exploration by other parties.</i></p>	<p>Yamarna: First exploration in the region was conducted in the eighties by BHP/MMC, followed by Western Mining Corporation Ltd (WMC) with Kilkenny Gold in the nineties and in early-mid 2000 by AngloGold Ashanti with Terra Gold. All subsequent work has been completed by Gold Road.</p> <p>Mallina: Exploration completed by DGO Gold in 2017 and 2019. All work completed since October 2022 has been completed by Gold Road.</p> <p>Greenvale/Galloway: First exploration in the region was conducted from 1995 to 1999 by Normandy Exploration. Since the early 2000's a number of junior exploration and prospecting companies such as Moggie Mining Pty Ltd and Malachite Resources have conducted cursory exploration activities in the area.</p>

Criteria and JORC Code explanation	Commentary
<p><i>Geology</i> <i>Deposit type, geological setting and style of mineralisation.</i></p>	<p>Yamarna: Orogenic gold mineralisation is hosted in the NNW striking/steeply NE dipping high strain Golden Highway Shear Zone (GHSZ) which is sub-parallel to the Yamarna Shear Zone, the western terrane boundary of the Yamarna Greenstone Belt. The GHSZ is interpreted as a third order splay from the second order Smokebush Shear Zone (at Wanderrrie) and the second order Yamarna Shear Zone, both of which splay from the first order Strawbridge Shear Zone at depth. The Strawbridge Shear Zone is interpreted to be the crustal scale structure controlling gold bearing fluid from the mantle within the Yamarna Terrane. Host rocks are predominantly mafic, intermediate and felsic sediments and volcanics of the Toppin Hill Group with minor mafics (basalts/dolerites) and occasional shales and tuffs. The sequence is metamorphosed to upper greenschist – lower amphibolite facies, typical of the Yamarna Terrane.</p> <p>Golden Highway and Renegade: Gold mineralisation dips steeply (60 to 80°) to the north-east and varies from 3 to 15 m wide but can be very thick at Attila +25 m wide and multiple shear zones. Mineralisation is associated with early amphibole-albite-biotite-sericite-quartz-garnet-carbonate alteration. The principal sulphide is pyrite, with rare disseminated arsenopyrite and pyrrhotite also observed. Visible gold is rare. East-west to Northeast striking cross faults occur at regular intervals and offset the mineralisation and stratigraphy by 10 to 50 m in plan view. These cross-faults appear to have some control on the geological character and quality of mineralisation that occurs within the fault bounded blocks and near to fault Offsets.</p> <p>Gilmour: Gold mineralisation dips steeply (70-80°) to the East and varies from 0.5-5m in width. Mineralisation is associated with a laminated vein, and series of subsidiary extension veins within the hangingwall sequence. The principal sulphide is arsenopyrite. Visible gold is common throughout the laminated vein.</p> <p>Smokebush: Gold Mineralisation dips moderate to steeply to the east (60-80°) and varies in thickness from 1-25m. Mineralisation is associated with extensive extensional vein arrays within a biotite – albite – chlorite altered shear zone within the granophyric zone of the Smokebush Dolerite. Mineralisation is associated with extensive arsenopyrite alteration. Mallina: Preserved within the Central Pilbara Tectonic Zone, the meso-Archaeon Mallina Basin comprises the upper Mallina Formation (typically fine to medium grained wacke and shale) and the underlying Constantine Formation (medium to coarse grained sandstones and conglomerate). Volcanic units including komatiitic basalt occur within the stratigraphy. The Mallina Basin is strongly deformed, with at least three deformation events resulting in large north-northeast trending folds and regional-scale shear zones. The Mallina Formation has been intruded by numerous granitic bodies including high-Mg diorite.</p>
<p><i>Drill hole Information</i> <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i></p> <ul style="list-style-type: none"> ▪ <i>easting and northing of the drill hole collar</i> ▪ <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> ▪ <i>dip and azimuth of the hole</i> ▪ <i>down hole length and interception depth</i> ▪ <i>hole length.</i> <p><i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i></p>	<p>All selected intersections, significant individual assays and collar information are provided in Appendices 1 to 3. Relevant plans and longitudinal projections are found in the body text and Appendix 1.</p>

Criteria and JORC Code explanation	Commentary
<p><i>Data aggregation methods</i></p> <p><i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i></p> <p><i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</i></p>	<p>Intersection lengths and grades are reported as down-hole length-weighted averages.</p> <p>No top cuts have been applied to the reporting of the assay results. Significant high individual grades are reported where the result(s) impacts the understanding of an intersection.</p> <p>Intersection lengths and grades for all holes are reported as down-hole length-weighted averages of grades above a cut-off and may include up to 2 m (cut-offs of 0.3 g/t Au and higher) or 4 m (0.1 g/t Au cut-off) of grades below that cut-off. Cut-offs of 0.1, 0.3, 0.5, 1.0 and/or 5.0 g/t Au are used depending on the drill type and results.</p> <p>Note that gram.metres (g.m) is the multiplication of the length (m) by the grade (g/t Au) of the drill intersection and provides the reader with an indication of intersection quality.</p> <p>Geologically selected intervals are used in later stage projects to honour interpreted thickness and grade from the currently established geological interpretation of mineralisation and may include varying grade lengths below the cut-off.</p>
<p><i>The assumptions used for any reporting of metal equivalent values should be clearly stated.</i></p>	<p>No metal equivalent values are used.</p>
<p><i>Relationship between mineralisation widths and intercept lengths</i></p> <p><i>These relationships are particularly important in the reporting of Exploration Results.</i></p> <p><i>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</i></p> <p><i>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</i></p>	<p>All mineralisation widths for exploration holes are reported as down hole lengths. True widths are yet to be established.</p>
<p><i>Diagrams</i></p> <p><i>Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.</i></p>	<p>Refer to Figures and Tables in the body of this and previous ASX announcements.</p>
<p><i>Balanced reporting</i></p> <p><i>Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</i></p>	<p>Intersection's lengths and grades for all holes are reported as down-hole length-weighted averages of grades above a cut-off and may include up to 2 m (cut-offs of 0.3 g/t Au and higher) or 4 m (0.1 g/t Au cut-off) of grades below that cut-off. Cut-offs of 0.1, 0.3, 0.5, 1.0, 5.0 and/or 10.0 g/t Au are used depending on the drill type and results.</p> <p>All collars drilled during the quarter are illustrated in Figure 3 and tabulated in Appendix 1 and Appendix 2.</p>
<p><i>Other substantive exploration data</i></p> <p><i>Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.</i></p>	<p>No other exploration data collected is meaningful outside of what is reported within this announcement.</p>
<p><i>Further work</i></p>	<p>At Yamarna, exploration activities will continue to focus on regional targets with the focus on accelerating 100% resources through to development. At the Golden Highway (Gruyere JV) feasibility work will continue to focus on advancing the project toward mining.</p> <p>At Mallina, DD drilling will continue in addition to geophysical surveys and surface mapping and geochemical sampling.</p> <p>At Greenvale, further data acquisition including remote sensing (spectral) and geophysical surveys will be completed.</p>
